

Writing Assignment 1 (Critical)

Yeeun Rachel Jo

1009379502

Item E

- **Describe your experience at each stage of writing (Outlining; Writing an essay yourself; Reading gen AI's version; Combining the two essays.) Which stage was the most difficult? Which stage of writing did you think you learned the most? Did you learn different things at different stages?**

Outlining was an excellent but sometimes challenging process because it made me careful in organizing my ideas before writing. It kept my ideas properly organized in a reasonable sequence and made writing simple for me to ensure that my points were logically connected so that writing would be simple. I also had an issue with choosing the most critical points to highlight and how to connect them. My greatest challenge was coming up with the essay on my own because it required that I explain all my ideas thoroughly, present valid evidence, and be consistent throughout. It was challenging for me to explain intricate ideas in a manner that would impress, remain brief to ensure that I am not repetitive, and present arguments effectively. At some point, I would struggle with how to phrase something or connect ideas coherently. It was interesting to see the AI-generated version because it reminded me of how to put my arguments differently and improved with more clarity. AI's version was more concise and linear, and that helped me investigate areas in what I was writing that

required clarification. For its part, I found AI's writing to be superficial and devoid of personal voice, and hence some of the arguments appeared too generic or less appealing. Merging the two essays was where I gained the most experience because it forced me to compare both versions critically and edit them into a better final product. This taught me how to sharpen my editing skills and balance clarity with complexity and have a consistent voice. I learned something at each phase—outlining helped in organization, writing taught me presentation and idea formulation, reading the AI version taught me conciseness and word selection, and combining both essays re-emphasized the importance of revision in the process of crafting a buffed, well-organized final output.

- **What are the comparative strengths and weaknesses of each piece of writing (including the outline)?**

Every step of writing in the process—outlining, writing myself, by AI, and combination the two—were strengths and weaknesses. The outline was a good beginning that served as a sort of blueprint to structure ideas and allow for clear argument flow. Writing was facilitated by pre-planning major points. But one failing of the outline was that I wasn't quite sure how to decide which of the ideas was most worth working out. In addition, I had the most control over my arguments and analysis and could develop in doing the essay myself. The weakness was that some of it was wordy, repetitive, or lacked transitions, making it harder to compress and make sense of writing by the AI version. A major strength of AI's writing was its clarity, conciseness, and organization—it was much more linear and direct than my original writing. This helped me recognize where my own writing needed improvement in terms of flow and readability. Yet the biggest flaw of the AI was that it did not have

depth or personal voice. Most of its points were far too general and lacked the sophistication of analysis in my initial piece. The combination of the two essays was the best stage because I was able to use the positives of both versions. I was able to retain my critical critique but used AI's structural improvements and ended up making the end product more efficient, clearer, and structured. The biggest challenge in this regard was to keep a consistent tone in the final essay.

- **Which essay, overall, seemed to address the prompt more effectively and why?**

The final combination version of the essay treated the question best because it balanced effective critical analysis with enhanced clarity and structure. My initial essay presented greater insight and a more nuanced discussion of the texts, but at times was lacking in conciseness and possessed some minor structural flaws. The AI was also more coherent and clear in language but not-personal in voice, and no actual textual analysis. Combined with the incorporation of theirs, I was able to retain my own depth while incorporating AI's form conciseness and clarity, with the resulting piece being more clear and coherent.

- **In the final version of the essay (Item D), what did you keep and what did you discard?**

For the last essay (Item D), I kept the introduction as it had already introduced the overall argument regarding how Frankenstein's artificial creatures in *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?* are mirrors to human emotions, values, and fears. Since it was already firm and appropriate to the prompt, there was no need to make extensive changes. However, I deleted Body Paragraphs 1-3, the quote-heavy sections, because they were too specific and broke up the flow of

analysis at times. In addition, I replaced quotation written by AI. While the quotes provided textual evidence, they had a tendency to turn the argument into a collection of evidence rather than a smooth discussion. Lastly, I added a rewritten conclusion to solidify the final impression of the essay. This then linked back to the introduction by summarizing the key points of the analysis in a more cohesive and effective way.

- **Did the AI actually make the writing process easier?**

Yes, AI did make it easier to write, but only in certain sections, because it helped with planning ideas, making it easier to read, and providing options for word changes, which made it simple to revise. With a more concise and structured version of my essay, AI helped me identify areas in my essay that needed polishing. Despite the fact that it never replaced the effort that went into deep analysis and critical thinking. The AI-written essay did not have depth, personal voice, and nuanced interaction with the texts' meaning.

- **Which version of the essay are you happiest with, and why?**

I am happiest with the final combined version of the essay because it possesses the best mix of strong critical insight and good, easy-to-read writing. My original essay was deeper in insight, but was sometimes too wordy, redundant, or lacking in smooth transitions. The version created by AI, though tighter and better-organized, was weaker in depth and personal voice especially explaining the quote. By integrating the two, I was in a position to maintain my close reading while incorporating AI's structural improvements, thereby creating the final essay more polished, consistent, and engaging.

- **Which version of the essay most accurately reflects your own skills and knowledge? Did using AI teach you anything new, either about the topic, or the art of writing?**

The best description of my skills and knowledge is the one I prepared myself because it shows my ability to analyze texts, construct an argument, and respond critically to the texts. While the AI-generated version was superior in structure and clarity, it lacked depth, especially in handling quotations and textual evidence. AI would quote or summarize but not fully interpret their meaning, whereas my initial essay provided stronger interpretations and more substantial interaction with the texts. AI struggled to meaningfully integrate quotes, which reminded me of the importance of explaining and connecting textual evidence rather than merely inserting it.

- **Do you feel you learned more, less, or the same amount from the experience of incorporating AI into your writing?**

I feel that I learned differently rather than more or less through using AI in my writing. Through AI, I could recognize areas in which my writing was vague, unclear, and not properly structured, and AI helped me learn to become an improved reviser. The critical thinking remained with me since I was incapable of providing reading and analysis in detail. While AI did simplify some aspects of writing, it still did not replace effort to make sound arguments and to recognize significant key themes.

- **Do you think using AI will help you grow as a writer, or is it simply a shortcut?**

I believe that AI can assist me in being a better writer, but only if utilized properly. It is not a substitute for writing—it serves best as a helper to work out and refine ideas, rather than substituting for originality. AI can assist with structure, brevity, and clarity,

and assist me in recognizing areas. However it is not capable of producing rich analysis, personal observation, or critical response to texts needed for effective writing. While AI can enhance revision methods and writing efficiency when effectively used, misuse of it can weaken critical thinking rather than strengthening it.

- **Do you feel your use of AI would be ethical for an assignment that *didn't* explicitly call for AI use?**

Whether it is ethical to use AI for an assignment that doesn't specifically mention using it or not is a matter of its usage. If AI is applied to create an entire essay with no original effort, then it would be unethical since it does compromise academic integrity. However if utilized for brainstorming, structure improvement, clarity, or sentence rewording—while retaining all analysis and arguments as my own—it is similar to the utilization of a tutor or writing assistant. Because of this, AI must be utilized as a learning tool, not a replacement for independent thinking and writing.

AI as Mirror for Humanity: Discuss how AI serves as a mirror for exploring human emotions, values, behaviors, and aspirations in Shelley's *Frankenstein*, Ishiguro's *Klara and the Sun*, and Dick, *Do Androids Dream of Electric Sheep?*. How does each work use artificial beings to reflect on what it means to be human? Do these works suggest that our AI creations reveal more about ourselves than the machines themselves? You may draw on Kakoudaki for your analysis.

Item A:

In *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?*, artificial beings serve as mirrors reflecting human emotions, values, and anxieties, ultimately revealing

more about humanity than themselves, as their very desire to become human paradoxically proves their lack of true humanity—a limitation explored by using restriction, paradox, and the essence of human identity, drawing on Kakoudaki's analysis.

The limitation

Even though the artificial beings in the novels strive for their humanity, it has the limitation of revealing the definition of human existence truly due to the factors only owned by humans.

Frankenstein - *"I am alone and miserable: man will not associate with me; but one as deformed and horrible as myself would not deny herself to me."* (Shelley 97)

- The Creature knows that he has failed to be accepted by society, and he is pointing out how humans mark the boundaries of belonging, morality, and exclusion. Most particularly, his existence asks if one can be human, yet his rejection assures that he is still essentially other.

Klara and the Sun - *"You're not being required simply to mimic Josie's outward behavior:*

You're being asked to continue her for Chrissie. And for everyone who loves Josie." (Ishiguro 187)

- Klara realizes that humanity is not merely about body or mind replication but about the depth of emotional connections and human relationships. Artificial entities lack the ability to form such relationships that endure like humans. In particular, it is the limitation of artificial entities which means that Klara can mimic actions, but she cannot replicate the depth of human emotions, love, and identity.

Do Androids Dream of Electric Sheep? – *"'You're androids,' Isidore said. But he didn't care; it made no difference to him. 'I see why they want to kill you,' he said. 'Actually you're not*

alive. ’’ (Dick 73)

- The androids seem alive, but they are fundamentally different in a way that prevents them from truly being human. Even when they try to fit into human society, their inability to feel genuine compassion or emotional depth sets them apart. Namely, Isidore’s statement highlights artificial identity—androids appear human but lack a crucial, ineffable essence.

The paradox

The artificial entities' desire for humanity ironically affirms their inhumanity since actual humanity resides in experiences as opposed to desires.

Frankenstein - *"I ought to be thy Adam, but I am rather the fallen angel, whom thou drivest from joy for no misdeed."* (Shelley 66)

- The creature believes he was created to be loved and cherished (like Adam) but is instead cast out and rejected (like Satan). Namely, the Creature's desire for humanity is his own tragedy. He possesses the mind, emotions, and moral sense of a human being, yet his unnatural birth ensures that he will never be accepted as such. Namely, his fate as an outsider is a cruel irony—his own humanity is the very thing that ensures he can never be part of it.

Klara and the Sun - *"Mr. Capaldi believed there was nothing special inside Josie that couldn't be continued. He told the Mother he'd searched and searched and found nothing like that. But I believe now he was searching in the wrong place. There was something very special, but*

it wasn't inside Josie. It was inside those who loved her." (Ishiguro 269)

- Human anxieties about AI, as Josie's mother ponders whether Klara could substitute for her daughter, thereby raising the unsettling question of whether AI can substitute for real humans. But the book ultimately reassures us that real human existence cannot be replicated. In particular, Klara's effort to replace Josie only serves to underscore the distinction between replica and reality, and those artificial beings, no matter how smart, will always fall short of the essence of being human.

Do Androids Dream of Electric Sheep? - *"An android, no matter how gifted as to pure intellectual capacity, could make no sense out of the fusion which took place routinely among the followers of Mercerism."*(Dick 14)

- Despite their advanced intelligence, androids lack Mercerism, the religion of compassion and empathic pain, revealing that human beings are not a rational entity but an emotionally bonding one. By their own aim to become human, precisely they show they contradict themselves since their inability to properly empathize serves to confirm finally that they cannot ever belong in human society.

The Essence of Human Identity

Artificial beings can simulate aspects of the essence of human behavior, but they fail to embody the depth of true human identity, which is shaped by mortality, suffering, and love.

Frankenstein - *"Cursed, cursed creator! Why did I live? Why, in that instant, did I not extinguish the spark of existence which you had so wantonly bestowed?"* (Shelley 91)

- His agony is uniquely foreign in that the agony of not born but created. His agony, in contrast to humans, who are born to suffer, is a product of a non-natural birth and

abandonment. Furthermore, his inquiry into the purpose of his creation as its evidence of inhumanity—humans do not ask why they were born.

Klara and the Sun - *"Klara, we're not asking you to train the new Josie. We're asking you to become her. That Josie you saw up there, as you noticed, is empty. If the day comes – I hope it doesn't, but if it does – we want you to inhabit that Josie up there with everything you've learned."* (Ishiguro 187)

- Klara is told that she is to "become" Josie, assuming all of her personality, decisions, and character. But this works to highlight the impossibility of substitution—no matter how completely Klara acts as Josie, she cannot truly have Josie's feelings, memories, or individual identity. Klara's willingness to undertake this task illustrates her desire to be human, but the fact that she must be "programmed" to do so proves her inhumanity.

Do Androids Dream of Electric Sheep? - *"He thought, too, about his need for a real animal; within him an actual hatred once more manifested itself toward his electric sheep, which he had to tend, had to care about, as if it lived. The tyranny of an object, he thought. It doesn't know I exist. Like the androids, it had no ability to appreciate the existence of another."* (Dick 20)

- The rage at his electric sheep is a symbol of his frustration with artificial life—while it can mimic a living animal, it cannot sense his presence, and his affection for it becomes hollow. The same applies to the androids, who, while intelligent and acting human, cannot truly enjoy the presence of others. Particularly, the ability to have genuine emotional connections and sense others as individuals, something that androids lack.

To conclude, in these three books, man-made beings try to be human, but their own desire is the strongest sign of their inhumanity. The Creature in *Frankenstein* desires love and acceptance, but his unnatural creation ensures he will never be accepted as human. Klara and the Sun believes that she can replace Josie, but her need to be programmed and conditioned to "become" her shows the impossibility of real replacement. The androids in *Do Androids Dream of Electric Sheep?* attempt to become part of the human world, but their inability to feel sympathy—the same as what they attempt to do—is a showing of their inability ever to belong. These pieces ultimately validate the paradox that the more human artificial beings attempt to be, the more their inherent inhumanness is exhibited.

Item B:

Since artificial intelligence (AI) reached where it is, artificial beings in most films and books were depicted as being quite similar to humans—either in voice, shape, or nature—mimicking human emotions, values, and aspirations. As well, Mary Shelley's *Frankenstein*, Kazuo Ishiguro's *Klara and the Sun*, and Philip K. Dick's *Do Androids Dream of Electric Sheep?* both portray artificial beings wanting to be human, but ironically, their own longing for humanity is only a confirmation of their inhumanity. If artificial beings were human, they would not need to persuade others by displaying their emotions, actions, or values in an attempt to prove their similarity to humans. Instead, their own efforts at humanity reveal the boundaries that separate them from real human existence. These works suggest that AI and artificial works tell us more about human nature than machines do themselves. In *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?*, artificial beings serve as mirrors reflecting human emotions, values, and anxieties, ultimately

revealing more about humanity than themselves, as their very desire to become human paradoxically proves their lack of true humanity—a limitation explored by using restriction, paradox, and the essence of human identity, drawing on Kakoudaki's analysis.

The limitation

Even though artificial beings in *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?* strive for humanity, they ultimately fail due to the fundamental elements of human existence that they lack—such as emotional depth, existential awareness, and social belonging. While they attempt to integrate into human society, their limitations expose the boundaries between mere imitation and true human identity. *Anatomy of a Robot* further emphasizes that artificial beings, despite their complexity, remain restricted by their mechanical nature, reinforcing the idea that they can never fully attain human experience. The Creature in *Frankenstein* struggles with rejection, knowing that he will never be truly accepted as human: “I am alone and miserable: man will not associate with me; but one as deformed and horrible as myself would not deny herself to me.” (Shelley 97) The Creature knows that his exclusion is not because of his intelligence or emotions but because of his unnatural condition. His pain is the same as humans, but his otherness is unavoidable—his artificial creation always makes him "other." His presence forces humanity to decide the boundaries of belonging, morality, and exclusion. Though he yearns to be with them, he can never belong since humans naturally think of him as being otherwise from themselves. The monster represents this—he is intelligent and emotionally sensitive, yet his monstrous visage acts to prevent him from society's acceptance. Namely, just as robots in modern AI research can simulate humanlike expressions yet are unable to evoke actual emotional reactions, the Creature's experience acts to demonstrate the gap between appearance and true integration into humanity. Likewise, in *Klara and the Sun*, Klara is supposed to substitute Josie

effortlessly, but her imitation attempt betrays the weaknesses of artificial substitution. .

You're being asked to continue her for Chrissie. And for everyone who loves Josie."

(Ishiguro 187), While Klara is capable of learning and replicating Josie's mannerisms, she ultimately lacks the emotional complexity and history that define Josie's identity. Namely, human relationships are not just about physical presence or learned behavior—they are shaped by shared experiences, emotional depth, and intrinsic selfhood. The expectation that Klara is able to "carry on" Josie betrays the limitation of AI beings—while they are able to emulate, they can never be human. Thus, Klara may observe and adapt, but her learning is still restricted within an artificial framework—she lacks independent consciousness and true emotional intuition. This reflects AI as a tool rather than a sentient being, emphasizing that human identity is not merely about external behaviors but tied to emotional connections and self-awareness. Furthermore, *Do Androids Dream of Electric Sheep?*, the androids appear nearly indistinguishable from humans, yet their fundamental lack of life experience separates them. In the book, Isidore said that "'You're androids,' ... But he didn't care; it made no difference to him. 'I see why they want to kill you,' he said. 'Actually you're not alive.'"

(Dick 73) This scene encapsulates the essential failing of androids—even when they perfectly imitate human life, they are missing an essential, intangible quality that makes life worth living. Isidore's hesitation is a result of the fact that surface-level copy does not equal authentic being. Regardless of their performance, the androids cannot help but be artificial—they are essentially other than real human beings. The androids can simulate and calculate human interactions but lack agency or self-awareness. This obviously illustrates the weakness that being human does not depend on the manner in which one conducts human activities but on an unbreachable, inimitable essence that cannot be done by AI. Therefore, the artificial people in *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?* illustrate that true humanity resides not in simulation but in selfhood independent of

mortality, pain, and relation. *Anatomy of a Robot* illustrates that artificial people, though advanced, are still circumscribed by outer control, predetermined function, and the absence of self-formed identity. The struggles of artificial beings are only meant to emphasize this fact—their attempts at becoming members of human society only expose their deficiencies. Even as they are able to imitate emotions, learn habits, or even express wants, they lack the inherent, unpredictable evolution that defines human life. Their aspiration for being human itself proves that they are not because real humanity cannot be performed but comes from mortality, suffering, and emotional sophistication. Lastly, these aspirations toward being human prove that artificial beings evidently possess limitations to acquire the element symbolizing humanities.

The paradox

Moreover, it can also represent that although artificial beings in *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?* strive for humanity, their failure reveals the paradox of their existence—their desire to be human only affirms their inhumanity. True humanity is not about imitation but arises from mortality, suffering, and self-awareness. Their longing to belong only highlights the unbridgeable gap between artificial life and real human experience. Namely, the artificial entities' desire for humanity ironically affirms their inhumanity since actual humanity resides in experiences as opposed to desires. For example, in *Frankenstein*, the Creature believes he was created to be loved, yet his unnatural existence ensures that he will always be an outsider. The book illustrates that "I ought to be thy Adam, but I am rather the fallen angel, whom thou drivest from joy for no misdeed." (Shelley 66), his tragedy is that he has the emotions, thoughts, and moral awareness of a human. However, his very existence prevents him from being accepted as one. The irony is that his suffering is deeply human, yet he remains forever separate from

humanity. The creature believes he was created to be loved and cherished but is instead cast out and rejected. Namely, the Creature's desire for humanity is his own tragedy. He possesses the mind, emotions, and moral sense of a human being, yet his unnatural birth ensures that he will never be accepted as such. Namely, his fate as an outsider is a cruel irony—his own humanity is the very thing that ensures he can never be part of it. As well, through Klara and the Sun, Klara, it represents how the artificial being have paradoxes. it was expected to seamlessly replace Josie, but her failure exposes the limits of artificial substitution. For instance "Mr. Capaldi believed there was nothing special inside Josie that couldn't be continued. He told the Mother he'd searched and searched and found nothing like that. But I believe now he was searching in the wrong place." (Ishiguro 269) This quote illustrate that Klara understands human behavior but lacks the depth that defines human relationships. While she can mimic Josie's mannerisms, she cannot recreate the unique emotional bonds that define Josie's identity. Klara's failure to truly "be" Josie demonstrates that human identity is not about surface replication but about shared history, relationships, and inner consciousness. To be more specific, human anxieties about AI, as Josie's mother ponders whether Klara could substitute for her daughter, thereby raising the unsettling question of whether AI can substitute for real humans. However ultimately people believe that real human existence cannot be replicated which means that no matter how smart, will always fall short of the essence of being human. Lastly, in *Do Androids Dream of Electric Sheep?*, the androids' inability to grasp the emotional depth of Mercerism reinforces their inhumanity. "An android, no matter how gifted as to pure intellectual capacity, could make no sense out of the fusion which took place routinely among the followers of Mercerism." (Dick 14) Namely, even as they think, act, and behave like humans, their lack of genuine empathy and existential depth ensures that they remain separate. The androids may process information, but they cannot experience the world in the same way humans do. Their inability to

understand Mercerism reflects the fundamental limitation of AI: intelligence without empathy is still artificial. This is to say, despite their advanced intelligence, android's lack Mercerism, the religion of compassion and empathic pain, revealing that human beings are not a rational entity but an emotionally bonding one. By their own aim to become human, precisely they show they contradict themselves since their inability to properly empathize serves to confirm finally that they cannot ever belong in human society. Therefore, *Anatomy of a Robot* makes it clear that artificial creatures, sophisticated, are still trapped by outside instructions, absence of self-generated goals, and shortage of independent personhood. They do not become human because they suffer but reinforce the irreplaceable aspects of humanity—suffering, mortality, and self-consciousness. Their striving for humanity only demonstrates their failure, not victory. Man is not an action to be replicated but a condition of existence which cannot be imitated. The irony remains that the very thing that these manufactured beings yearn for humanity is the best proof that they shall never truly possess it.

The Essence of Human Identity

Artificial beings can simulate some human actions, but they cannot capture the richness of true human identity, which is shaped by mortality, suffering, and love. No matter how much they simulate human action, they lack the internal emotional depth and existential awareness that make up what it truly is to be human. Their being is defined by external programming and not by self-derived purpose, which reinforces the notion that authentic identity cannot be taught but is something developed through lived experience. In *Frankenstein*, it represents well how the artificial lack of essence of human indeed. The Creature experiences deep existential anguish, yet his suffering is inherently different from human suffering. He asks, "Cursed, cursed creator! Why did I live? Why, in that instant, did I

not extinguish the spark of existence which you had so wantonly bestowed?" (Shelley, p. 91).

Unlike humans, who are born without choice, the Creature was deliberately created, and his agony stems from this unnatural origin. His suffering highlights the fundamental difference between human pain, which is tied to mortality and the natural passage of life, and artificial suffering, which is a byproduct of rejection and unnatural existence. Their pain, if it exists, is externally imposed rather than internally felt, making their experience fundamentally alien rather than authentically human. Namely, His agony, in contrast to humans, who are born to suffer, is a product of a non-natural birth and abandonment. Furthermore, his inquiry into the purpose of his creation as its evidence of inhumanity—humans do not ask why they were born. In addition, in *Klara and the Sun*, Klara is expected to replace Josie, but her inability to form real emotional connections proves the limitations of artificial beings. For example, "Klara, we're not asking you to train the new Josie. We're asking you to become her."

(Ishiguro 187). Even while Klara can simulate Josie's actions, she cannot duplicate the intrinsic selfness, emotionality, and relationality that comprise Josie's self. She lives off external conditioning, and the fact that she must be trained in order to "become" Josie attests to the fact that she has no authentic agency. Most especially, the fact that Klara is a substitute only further asserts the fact of impossibility regarding duplicating an actual human. Klara's determination to perform this task indicates she desires to be human, but the fact that she must be "programmed" in order to accomplish this confirms her inhumanity. In *Do Androids Dream of Electric Sheep?*, androids are nearly indistinguishable from human beings but lack of emotional attachment serves to make their artificialness evident. The quotation reflects that "He thought, too, about his need for a real animal; within him an actual hatred once more manifested itself toward his electric sheep, which he had to tend, had to care about, as if it lived. The tyranny of an object, he thought. It doesn't know I exist." (Dick 20). This scene highlights the emptiness of false life—resents the electric sheep because it is nothing more

than a machine and cannot recognize his presence. This is analogous to the androids themselves, who are capable of mimicking human interaction but lack genuine awareness of others. Namely, AI and artificial beings, no matter how advanced, lack relational depth, reiterating the fact that humanness is not a function of intelligence alone but of the capacity for forming deep, intrinsic emotional connection. The same goes for the androids, who, despite being intelligent and acting human, cannot truly enjoy the company of others. Particularly, the ability to have genuine emotional connections and sense others as individuals, something that androids lack. Namely, AI and artificial beings, no matter how complex, lack true relational depth, emphasizing the idea that humanity is not just about intelligence but about the capacity for deep, intrinsic emotional connection. Thus, *Anatomy of a Robot* makes it clear that artificial beings, no matter how sophisticated, remain trapped by external programming, a lack of self-derived purpose, and an absence of independent selfhood. Their failures are not just limitations, but boundaries that reinforce what makes humanity irreplaceable—mortality, suffering, and the ability to form emotional bonds. Namely, these works affirm that artificial beings do not become human simply by suffering or desiring humanity—they only expose the qualities that set humans apart. Their pursuit of humanity is not proof of their success, but of their inevitable failure. The irony remains that the strongest evidence of their inhumanity is the very fact that they must strive to be human in the first place.

To conclude, in these three books, man-made beings try to be human, but their own desire is the strongest sign of their inhumanity. The Creature in *Frankenstein* desires love and acceptance, but his unnatural creation ensures he will never be accepted as human. Klara and the Sun believes that she can replace Josie, but her need to be programmed and conditioned

to "become" her shows the impossibility of real replacement. The androids in *Do Androids Dream of Electric Sheep?* attempt to become part of the human world, but their inability to feel sympathy—the same as what they attempt to do—is a showing of their inability ever to belong. These pieces ultimately confirm the paradox that the more human that artificial creations attempt to be, the more their own inhumanity is revealed. These pieces then suggest that the pursuit of humanity by artificial beings is not a sign of success but of some failure. The irony nonetheless remains that the most tangible proof of their inhumanity is quite that they are attempting to be human at all.

Item C

I asked a generative AI program, *Goole Gemini*, to produce an essay based on the outline. I asked to make the essay after giving my outline.

The screenshot shows the Gemini AI web interface. At the top, the Gemini logo and '2.0 Flash' are visible. A prompt box contains the text: '(this is my outline, write essay) In Frankenstein, Klara and the Sun, and Do Androids Dream of Electric Sheep?, artificial beings serve as...'. Below the prompt, a blue star icon indicates a generated response. The response begins with 'Absolutely! Let's transform your detailed outline into a cohesive and compelling essay.' followed by the title 'The Paradox of Humanity: Artificial Beings and the Search for Self in Frankenstein, Klara and the Sun, and Do Androids Dream of Electric Sheep?'. The essay text discusses the paradox of humanity in three works: Mary Shelley's *Frankenstein*, Kazuo Ishiguro's *Klara and the Sun*, and Philip K. Dick's *Do Androids Dream of Electric Sheep?*. It highlights the tragic impossibility of artificial beings bridging the gap between creation and creator, and the primary limitations of these beings, such as their inability to fully embody human experience and their lack of genuine compassion. The interface includes a sidebar with icons for chat, history, and settings, and a bottom bar with a search icon and a microphone icon.

The Paradox of Humanity: Artificial Beings and the Search for Self in Frankenstein, Klara

and the Sun, and Do Androids Dream of Electric Sheep?

In Mary Shelley's *Frankenstein*, Kazuo Ishiguro's *Klara and the Sun*, and Philip K. Dick's *Do Androids Dream of Electric Sheep?*, artificial beings serve as profound mirrors, reflecting the intricacies of human emotions, values, and anxieties. Ironically, their fervent desire to attain humanity exposes their inherent lack of it. This paradox, explored through the lenses of limitation, contradiction, and the essence of human identity—drawing on Kakoudaki's analysis—reveals the tragic impossibility of artificial beings ever truly bridging the gap between creation and creator.

One of the primary limitations faced by these artificial beings is their inability to fully embody the human experience. In *Frankenstein*, the Creature's lament, "I am alone and miserable: man will not associate with me; but one as deformed and horrible as myself would not deny herself to me" (Shelley 97), underscores the human tendency to establish boundaries of belonging. His rejection by society, despite his longing for connection, highlights that his very existence challenges the definition of humanity. Similarly, in *Klara and the Sun*, Klara is tasked with "continuing" Josie for her loved ones (Ishiguro 187). She soon realizes that humanity is not merely about replicating physical or mental attributes but about the depth of emotional connections, a realm she can only mimic, not truly inhabit. In *Do Androids Dream of Electric Sheep?*, the androids, despite their advanced intelligence, are fundamentally different, lacking the capacity for genuine compassion. As Isidore observes, "Actually you're not alive" (Dick 73), highlighting their lack of an ineffable essence that defines true humanity.

This limitation leads to a central paradox: the very desire of artificial beings to become human affirms their inherent inhumanity. In *Frankenstein*, the Creature's longing for love and acceptance, akin to Adam, is met with rejection and isolation, like Satan (Shelley 66). His humanity, or the closest approximation he can achieve, becomes his tragic flaw, ensuring his perpetual alienation. In *Klara and the Sun*, Klara's efforts to replace Josie underscore the fundamental difference between replication and reality (Ishiguro 269). The anxieties surrounding AI's potential to replace humans are ultimately assuaged by the realization that true human existence cannot be replicated. In *Do Androids Dream of Electric Sheep?*, the androids' inability to comprehend Mercerism, a religion of compassion and empathetic pain, reveals their inherent contradiction (Dick 14). Their striving for humanity only highlights their inability to truly empathize, thus confirming their exclusion from human society.

The essence of human identity, as revealed in these narratives, is deeply rooted in experiences of mortality, suffering, and love—qualities that artificial beings can simulate but never fully embody. In *Frankenstein*, the Creature's agony, born of his unnatural creation and abandonment, is a suffering unique to his existence (Shelley 91). His questioning of his purpose is a testament to his inhumanity, as humans do not typically question their own origins. In *Klara and the Sun*, Klara's task to "become" Josie highlights the impossibility of substitution (Ishiguro 187). Despite her ability to mimic Josie's personality, she can never truly possess her feelings, memories, or individual identity. In *Do Androids Dream of Electric Sheep?*, Deckard's frustration with his electric sheep, which cannot sense his presence, mirrors the androids' inability to form genuine emotional connections (Dick 20). This lack of reciprocal emotional engagement underscores their fundamental difference from humans.

In conclusion, *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?* utilize artificial beings to explore the complex and paradoxical nature of humanity. The more these beings strive to become human, the more they reveal their inherent limitations, highlighting the impossibility of fully replicating the lived experiences, emotional depth, and intrinsic connections that define human existence. Through their struggles, these artificial beings serve as poignant mirrors, reflecting the very essence of what it means to be human—an essence that remains uniquely and irreplaceably human. The paradox lies in the realization that the pursuit of humanity by artificial beings ultimately underscores their fundamental otherness, solidifying the boundaries between creation and the human experience.

Item D

Since artificial intelligence (AI) reached where it is, artificial beings in most films and books were depicted as being quite similar to humans—either in voice, shape, or nature—mimicking human emotions, values, and aspirations. As well, Mary Shelley's *Frankenstein*, Kazuo Ishiguro's *Klara and the Sun*, and Philip K. Dick's *Do Androids Dream of Electric Sheep?* both portray artificial beings wanting to be human, but ironically, their own longing for humanity is only a confirmation of their inhumanity. If artificial beings were human, they would not need to persuade others by displaying their emotions, actions, or values in an attempt to prove their similarity to humans. Instead, their own efforts at humanity reveal the boundaries that separate them from real human existence. These works suggest that AI and artificial works tell us more about human nature than machines do themselves. In *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?*, artificial beings serve as mirrors reflecting human emotions, values, and anxieties, ultimately

revealing more about humanity than themselves, as their very desire to become human paradoxically proves their lack of true humanity—a limitation explored by using restriction, paradox, and the essence of human identity, drawing on Kakoudaki's analysis.

Even though artificial beings in *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?* strive for humanity, they ultimately fail due to the fundamental elements of human existence that they lack—such as emotional depth, existential awareness, and social belonging. While they attempt to integrate into human society, their limitations expose the boundaries between mere imitation and true human identity. *Anatomy of a Robot* further emphasizes that artificial beings, despite their complexity, remain restricted by their mechanical nature, reinforcing the idea that they can never fully attain human experience.

Frankenstein, the Creature's lament, "I am alone and miserable: man will not associate with me; but one as deformed and horrible as myself would not deny herself to me" (Shelley 97), underscores the human tendency to establish boundaries of belonging. His rejection by society, despite his longing for connection, highlights that his very existence challenges the definition of humanity. The Creature knows that his exclusion is not because of his

intelligence or emotions but because of his unnatural condition. His pain is the same as humans, but his otherness is unavoidable—his artificial creation always makes him "other." His presence forces humanity to decide the boundaries of belonging, morality, and exclusion. Though he yearns to be with them, he can never belong since humans naturally think of him as being otherwise from themselves. The monster represents this—he is intelligent and emotionally sensitive, yet his monstrous visage acts to prevent him from society's acceptance. Namely, just as robots in modern AI research can simulate humanlike expressions yet are unable to evoke actual emotional reactions, the Creature's experience acts to demonstrate the gap between appearance and true integration into humanity. Likewise, in *Klara and the Sun*,

Klara is supposed to substitute Josie effortlessly, but her imitation attempt betrays the weaknesses of artificial substitution. . You're being asked to continue her for Chrissie. And for everyone who loves Josie." (Ishiguro 187), While Klara is capable of learning and replicating Josie's mannerisms, she ultimately lacks the emotional complexity and history that define Josie's identity. Namely, human relationships are not just about physical presence or learned behavior—they are shaped by shared experiences, emotional depth, and intrinsic selfhood. The expectation that Klara is able to "carry on" Josie betrays the limitation of AI beings—while they are able to emulate, they can never be human. Thus, Klara may observe and adapt, but her learning is still restricted within an artificial framework—she lacks independent consciousness and true emotional intuition. This reflects AI as a tool rather than a sentient being, emphasizing that human identity is not merely about external behaviors but tied to emotional connections and self-awareness. The androids can simulate and calculate human interactions but lack agency or self-awareness. This obviously illustrates the weakness that being human does not depend on the manner in which one conducts human activities but on an unbreachable, inimitable essence that cannot be done by AI. Therefore, the artificial people in *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?* illustrate that true humanity resides not in simulation but in selfhood independent of mortality, pain, and relation. *Anatomy of a Robot* illustrates that artificial people, though advanced, are still circumscribed by outer control, predetermined function, and the absence of self-formed identity. The struggles of artificial beings are only meant to emphasize this fact—their attempts at becoming members of human society only expose their deficiencies. Even as they are able to imitate emotions, learn habits, or even express wants, they lack the inherent, unpredictable evolution that defines human life. Their aspiration for being human itself proves that they are not because real humanity cannot be performed but comes from mortality, suffering, and emotional sophistication. Lastly, these aspirations toward being

human prove that artificial beings evidently possess limitations to acquire the element symbolizing humanities. Furthermore, in *Do Androids Dream of Electric Sheep?*, the androids, despite their advanced intelligence, are fundamentally different, lacking the capacity for genuine compassion. As Isidore observes, “Actually you’re not alive” (Dick 73), highlighting their lack of an ineffable essence that defines true humanity. Isidore's hesitation is a result of the fact that surface-level copy does not equal authentic being. Regardless of their performance, the androids cannot help but be artificial—they are essentially other than real human beings. The androids can simulate and calculate human interactions but lack agency or self-awareness. This obviously illustrates the weakness that being human does not depend on the manner in which one conducts human activities but on an unbreachable, inimitable essence that cannot be done by AI. Therefore, the artificial people in *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?* illustrate that true humanity resides not in simulation but in selfhood independent of mortality, pain, and relation. *Anatomy of a Robot* illustrates that artificial people, though advanced, are still circumscribed by outer control, predetermined function, and the absence of self-formed identity. The struggles of artificial beings are only meant to emphasize this fact—their attempts at becoming members of human society only expose their deficiencies. Even as they are able to imitate emotions, learn habits, or even express wants, they lack the inherent, unpredictable evolution that defines human life. Their aspiration for being human itself proves that they are not because real humanity cannot be performed but comes from mortality, suffering, and emotional sophistication. Lastly, these aspirations toward being human prove that artificial beings evidently possess limitations to acquire the element symbolizing humanities.

Moreover, it can also represent that although artificial beings in *Frankenstein*, *Klara and the Sun*, and *Do Androids Dream of Electric Sheep?* strive for humanity, their failure

reveals the paradox of their existence—their desire to be human only affirms their inhumanity. True humanity is not about imitation but arises from mortality, suffering, and self-awareness. Their longing to belong only highlights the unbridgeable gap between artificial life and real human experience. Namely, the artificial entities' desire for humanity ironically affirms their inhumanity since actual humanity resides in experiences as opposed to desires. For example, in *Frankenstein*, the Creature believes he was created to be loved, yet his unnatural existence ensures that he will always be an outsider. The book illustrates that "I ought to be thy Adam, but I am rather the fallen angel, whom thou drivest from joy for no misdeed." (Shelley 66), his tragedy is that he has the emotions, thoughts, and moral awareness of a human. However, his very existence prevents him from being accepted as one. The irony is that his suffering is deeply human, yet he remains forever separate from humanity. The creature believes he was created to be loved and cherished but is instead cast out and rejected. Namely, the Creature's desire for humanity is his own tragedy. He possesses the mind, emotions, and moral sense of a human being, yet his unnatural birth ensures that he will never be accepted as such. Namely, his fate as an outsider is a cruel irony—his own humanity is the very thing that ensures he can never be part of it. As well, through Klara and the Sun, Klara, it represents how the artificial being have paradoxes. it was expected to seamlessly replace Josie, but her failure exposes the limits of artificial substitution. *In Klara and the Sun, Klara's efforts to replace Josie underscore the fundamental difference between replication and reality (Ishiguro 269). The anxieties surrounding AI's potential to replace humans are ultimately assuaged by the realization that true human existence cannot be replicated.* While she can mimic Josie's mannerisms, she cannot recreate the unique emotional bonds that define Josie's identity. Klara's failure to truly "be" Josie demonstrates that human identity is not about surface replication but about shared history, relationships, and inner consciousness. To be more specific, human anxieties about AI, as Josie's mother

ponders whether Klara could substitute for her daughter, thereby raising the unsettling question of whether AI can substitute for real humans. However ultimately people believe that real human existence cannot be replicated which means that no matter how smart, will always fall short of the essence of being human. Lastly, in *Do Androids Dream of Electric Sheep?*, the androids' inability to grasp the emotional depth of Mercerism reinforces their inhumanity. "An android, no matter how gifted as to pure intellectual capacity, could make no sense out of the fusion which took place routinely among the followers of Mercerism." (Dick 14) Namely, even as they think, act, and behave like humans, their lack of genuine empathy and existential depth ensures that they remain separate. The androids may process information, but they cannot experience the world in the same way humans do. Their inability to understand Mercerism reflects the fundamental limitation of AI: intelligence without empathy is still artificial. This is to say, despite their advanced intelligence, android's lack Mercerism, the religion of compassion and empathic pain, revealing that human beings are not a rational entity but an emotionally bonding one. By their own aim to become human, precisely they show they contradict themselves since their inability to properly empathize serves to confirm finally that they cannot ever belong in human society. Therefore, *Anatomy of a Robot* makes it clear that artificial creatures, sophisticated, are still trapped by outside instructions, absence of self-generated goals, and shortage of independent personhood. They do not become human because they suffer but reinforce the irreplaceable aspects of humanity—suffering, mortality, and self-consciousness. Their striving for humanity only demonstrates their failure, not victory. Man is not an action to be replicated but a condition of existence which cannot be imitated. The irony remains that the very thing that these manufactured beings yearn for humanity is the best proof that they shall never truly possess it.

Artificial beings can simulate some human actions, but they cannot capture the

richness of true human identity, which is shaped by mortality, suffering, and love. No matter how much they simulate human action, they lack the internal emotional depth and existential awareness that make up what it truly is to be human. Their being is defined by external programming and not by self-derived purpose, which reinforces the notion that authentic identity cannot be taught but is something developed through lived experience. In

Frankenstein, it represents well how the artificial lack of essence of human indeed. The Creature experiences deep existential anguish, yet his suffering is inherently different from human suffering. He asks, "Cursed, cursed creator! Why did I live? Why, in that instant, did I not extinguish the spark of existence which you had so wantonly bestowed?" (Shelley, p. 91).

Unlike humans, who are born without choice, the Creature was deliberately created, and his agony stems from this unnatural origin. His suffering highlights the fundamental difference between human pain, which is tied to mortality and the natural passage of life, and artificial suffering, which is a byproduct of rejection and unnatural existence. Their pain, if it exists, is externally imposed rather than internally felt, making their experience fundamentally alien rather than authentically human. Namely, His agony, in contrast to humans, who are born to suffer, is a product of a non-natural birth and abandonment. Furthermore, his inquiry into the purpose of his creation as its evidence of inhumanity—humans do not ask why they were

born. In addition, in *Klara and the Sun*, Klara is expected to replace Josie, but her inability to form real emotional connections proves the limitations of artificial beings. For example,

"Klara, we're not asking you to train the new Josie. We're asking you to become her."

(Ishiguro 187). Even while Klara can simulate Josie's actions, she cannot duplicate the intrinsic selfness, emotionality, and relationality that comprise Josie's self. She lives off external conditioning, and the fact that she must be trained in order to "become" Josie attests to the fact that she has no authentic agency. Most especially, the fact that Klara is a substitute only further asserts the fact of impossibility regarding duplicating an actual human. Klara's

determination to perform this task indicates she desires to be human, but the fact that she must be "programmed" in order to accomplish this confirms her inhumanity. In *Do Androids Dream of Electric Sheep?*, androids are nearly indistinguishable from human beings but lack of emotional attachment serves to make their artificialness evident. The quotation reflects that "He thought, too, about his need for a real animal; within him an actual hatred once more manifested itself toward his electric sheep, which he had to tend, had to care about, as if it lived. The tyranny of an object, he thought. It doesn't know I exist." (Dick 20). This scene highlights the emptiness of false life—resents the electric sheep because it is nothing more than a machine and cannot recognize his presence. This is analogous to the androids themselves, who are capable of mimicking human interaction but lack genuine awareness of others. Namley, AI and artificial beings, no matter how advanced, lack relational depth, reiterating the fact that humanness is not a function of intelligence alone but of the capacity for forming deep, intrinsic emotional connection. The same goes for the androids, who, despite being intelligent and acting human, cannot truly enjoy the company of others. Particularly, the ability to have genuine emotional connections and sense others as individuals, something that androids lack. Namley, AI and artificial beings, no matter how complex, lack true relational depth, emphasizing the idea that humanity is not just about intelligence but about the capacity for deep, intrinsic emotional connection. Thus, *Anatomy of a Robot* makes it clear that artificial beings, no matter how sophisticated, remain trapped by external programming, a lack of self-derived purpose, and an absence of independent selfhood. Their failures are not just limitations, but boundaries that reinforce what makes humanity irreplaceable—mortality, suffering, and the ability to form emotional bonds. Namely, these works affirm that artificial beings do not become human simply by suffering or desiring humanity—they only expose the qualities that set humans apart. Their pursuit of humanity is not proof of their success, but of their inevitable failure. The irony remains that

the strongest evidence of their inhumanity is the very fact that they must strive to be human in the first place.

To conclude, in these three books, man-made beings try to be human, but their own desire is the strongest sign of their inhumanity. The Creature in Frankenstein desires love and acceptance, but his unnatural creation ensures he will never be accepted as human. Klara and the Sun believes that she can replace Josie, but her need to be programmed and conditioned to "become" her shows the impossibility of real replacement. The androids in Do Androids Dream of Electric Sheep?. attempt to become part of the human world, but their inability to feel sympathy—the same as what they attempt to do—is a showing of their inability ever to belong. These pieces ultimately confirm the paradox that the more human that artificial creations attempt to be, the more their own inhumanity is revealed. These pieces then suggest that the pursuit of humanity by artificial beings is not a sign of success but of some failure. The irony nonetheless remains that the most tangible proof of their inhumanity is quite that they are attempting to be human at all. Through their struggles, these artificial beings serve as poignant mirrors, reflecting the very essence of what it means to be human—an essence that remains uniquely and irreplaceably human.
